                                                                                                                                                                                                                                                                                                                                                            000000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0000000000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ő
pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

                                                                                                                                                                                                                                                                                                                                                                                           CC neural cell adhesion molecules. A modified direct CDNA selection CC technique was applied to bacterial and plantificial chromosomes CC brain. A unique cDNA fragment, designated E51 (see V31982), was CC obtained and used to screen a trisomy 21 human foetal CC brain. A unique cDNA fragment, designated E51 (see V31982), was CC obtained and used to screen a trisomy 21 human foetal brain (14-wk CC gestation) cDNA library. Further clones were obtained by exon CC trapping, and the complete DS-CAM2 cDNA sequence was identified. CC DS-CAM2 is a splice variant of membrane-bound DS-CAM1 (see W42086) CC and is deleted for the entire transmembrane domain. The DS-CAM CC gene spans 900-1200 kb of genomic DNA and maps at chromosome CC 1922.2-22.3. The invention also provides murine DS-CAM partial CC sequences (see V31985-87), expression vectors and host cells, cc transgenic animals, antisense oligonucleotides, and primers useful CC for amplification of DS-CAM nucleic acid. DS-CAM polypeptides are cc associated with developmental and neurological processes. They can be used in e.g. neural prostatetic devices used in entubulation compared therapy of developmental and neurological abnormalities such as CC Down syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized hypothalamus library cDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP CDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. The following repetitive elements were found in this cDNA sequence:

1-52, >A:_richtLow complexity
                                                                                                                                                                                                                                       361
                                                                                                                                                                                                                                                                                                                        421

pred. No. is the number of results predicted by chance to have
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Location/oualifier CDS Key 453518 W09817795-A1. 30-APR-1998. 23-OCT-1996; US-029322. (CEDA) CEDARS SINAI MEDICAL CENT. Korenberg JR; WPI, 98-271791/24. P-PSDB; W42087. P-PSDB; W42087. P-PSDB; W42087. New isolated Down's Syndrome-cell developmental and neurological abortion and solutions of the 1g supplied to a novel subclass of the 1g supplied to horizolate was applied to barin. A unique cDNA iragment, descended between ETS2 and MXI by using cDNA brain. A unique cDNA iragment, deschained and used to screen a tritechnique was applied to horizolate to barin and used to screen a tritechnique was applied to horizolabetween ETS2 and MXI by using cDNA brain. A unique cDNA iragment, deschained and used to screen a tritechnique was applied to horizolabetween ETS2 and MXI by using cDNA brain. A unique cDNA iragment, deschained and used to screen a tritechnique was applied to horizolabetween ETS2 and the complete DS-CAM. Screen a tritechnique was applied to horizolabetween ETS2 and the complete DS-CAM. Screen a tritechnique was applied to horizolabetween ETS2 and the complete DS-CAM. Screen a tritechnique spans 900-1200 kb of genomic 21922-2-2.3. The invention also sequences (see V31985-87), express transgenic animals, antisense olitical for amplification of DS-CAM nucle associated with developmental and be used in e.g. neural prosthetic metwas The products can also be therapy of developmental retardation the compus callosum, or schizence are used for inhibiting translation sequence 6413 BP; 1633 A; | 000000000 |

Statistics: Mean 40.973; Variance 226.720; scale 0.181

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New isolated Down's Syndrome-cell adhesion molecule - used to pT develop products for detection, diagnosis and therapy of developmental and neurological abnormalities

PT developmental and neurological abnormalities

PS Claim 2; Page 90-95; 109pp; English.

CC This polypeptide comprises Down syndrome-cell adhesion molecule

CC Subclass of the 1g superfamily with highest homology to neural cell

CC adhesion molecules. Its amino acid sequence was deduced from cDNA

CC clones (see v31982) isolated from a trisomy 21 foetal brain library.

CC It is a splice variant of membrane-bound DS-CAM1 (see W42086), and

CC lacks the entire transmembrane domain of DS-CAM1. The invention

CC provides human and murine DS-CAM nucleic acid sequences (see also

CC V31981, V31985-87), expression vectors and host cells, transgenic

CC animals, antibodies, antisense oligonucleotides, and primers

CC animals, antibodies, antisense oligonucleotides, and primers

CC canimals, antibodies, antisense oligonucleotides, and primers

CC canimals, antibodies, antisense oligonucleotides, and primers

CC crepating (regenerating) damaged or severed propentides are associated

CC unith developmental and neurological processes. They can be used in

CC repating (regenerating) damaged or severed peripheral nerves, and

CC can also be used in detection, diagnosis and therapy of developmental

CC can also be used in detection, diagnosis and therapy of developmental

CC can also holoprosencephaly, agenesis of the corpus callcsum,

CC or schizencephaly.

Description: Perfect Score: (1-1571) from US08956991A.pep 11189 1 MWILALSLFQSFANVFSEDL......NSAGCAEKQAKEAARCKEFS 1571

Sequence:

Scoring table: PAM 150 Gap 11

Searched: 142080 segs, 47172406 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir62 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 55.886; Variance 106.625; scale 0.524

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tue Apr 25 13:32:01 2000: MasPar time 48.10 Seconds 975.450 Million cell updates/sec

Tabular output not generated.

Title: Description: >US-08-956-991-11 (1-1571) from US08956991A.pep 11189 1 MWILALSIFOCTO

Perfect So Sequence: Score: MWILALSLFQSFANVFSEDL......NSAGCAEKQAKEAARCKEFS 1571

Scoring table: PAM 150 Gap 11

82229 seqs, 29864866 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot38 1:swissprot

Statistics: Mean 56.705; Variance 92.824; scale 0.611

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 55.040; Variance 95.336; scale 0.577

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                      CC This CDNA C. Jue codes for Down syndrome-cell adhesion molecule DS-CAM2 (see W42087), an extracellular, soluble protein belonging CC to a novel s.Dclass of the Ig superfamily with highest homology to CR neural cell adhesion molecules. A modified direct cDNA selection CC technique was applied to bacterial and P1 artificial chromosomes CC between ETS2 and MX1 by using cDNA from trisomy 21 human foetal CR brain. A unique cDNA fragment, designated E51 (see V31982), was CC obtained and used to screen a trisomy 21 human foetal brain (14-wk CR gestation) cDNA library. Further clones were obtained by exon CR trapping, and the complete DS-CAM2 cDNA sequence was identified. CR dand is deleted for the entire transmembrane domain. The DS-CAM CR and is deleted for the entire transmembrane domain. The DS-CAM CR 1120.2-2.3. The invention also provides murine DS-CAM partial CR sequences (see V31985-87), expression vectors and host cells, casconisted with developmental and nanrolocated. DS-CAM polypeptides are CR associated with developmental and narrolocated increases. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       documentation_block:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human Down syndrome-cell adhesion molecule DS-CAM2 cDNA. DS-CAM2; Down syndrome-cell adhesion molecule; neural cell; signal transduction; trisomy 21; mental retardation; holoprosencephaly; corpus callosum agenesis; schizencephaly; diagnosis; assay; human; ds; ss.
associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (regenerating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and therapy of developmental and neurological abnormalities such as Down syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides are used for inhibiting translation of mRNA.
